There are a lot of nail guns out there, and different types, so we did research for you and rounded up the best options to be in the most similar categories of interest to DIYers. Here are the best nail guns on the market right now: a good nail gun should be easy to use, long lasting, and drive nails fast and clean without any issues. To do this, nail guns need to build hard and have a lot of options you can customize while working. DeWalt DWFP12231 checks all these boxes as the top pick in this list. It delivers a lot of durability from your magnesium body and motor drive without maintenance. It is also designed to be lightweight and safe to use with a light comet trigger and rear exhaust valve that keeps harmful pollution away from you. The nail gun runs off of separate air compressors/hoses and uses 18 nail gauges ranging from 5/8-2 inches in length. It has 100 nail working capacity and many custom options how you use the tool. You can control the depth of the nail with a simple setting without tools. When you're not using it, the gun also comes with adjustable belt hooks to keep the tools hanging next to you, available to you. If you want an option with no more, Porter Cable PCC790LA provides many of the same capabilities as other competitors. Typically, nail guns don't offer batteries as much as those using air compressors and punch hoses, but for projects that use softer materials or looser depths, a nail gun is the act of walking battery. Just charge the battery, stick it to the nail gun and you're ready to go. Nail guns are designed around comfort and portability. In addition to wireless design, the weight of the tool is concentrated near the handle, which will reduce hand fatigue during long projects. All common and release settings such as depth adjustment and jam lever tool are free. The magazine uses 100 pegs from 18 nail gauges. Budget nail guns tend to be smaller and more portable. While you're saving some money, you can also save on weight with 3 pounds WEN 61721. Designed to fire a 18-gauge Brad 3/8 inch to 2 inches in length, this nail gun is a good start or secondary gun if you're looking to expand. The gun works with any air compressor and can operate anywhere from 60 to 115 PSI, ensuring that you have enough power to drive nails into hard materials. For extra comfort, gun The ergonomic rubber grip is made right into the handle. The rubber absorbs the shock that periods up the nail gun with each shot, preventing the energy from getting into your hands. This helps to reduce fatigue while protecting your hands and wrists from injury. The NuMax 52-116G2 is proof that some budget options don't necessarily tumble on more professional features. One common feature of many expensive nail guns is the ability to use multiple types of nails and brad. For a fraction of the cost, this gun gives you the same flexibility. With either a common 2-inch 18 gauge or 1.5/8 inch narrow staples, you can choose the right Chester to work right on the fly. Another professional feature of this gun includes a snake-free tip. While working on delicate surfaces, this tip prevents the gun from turning and doing major damage. Typically, this is necessary when nailing fragile materials such as decorative trims, base boards and various types of molding. Beyond a simpler design, electric nail guns also offer a quick way to set up and go than you don't have to connect three separate pieces together. The Stanley TRE550Z utilizes the flexibility of an electric drive using the Stanley Sharp Shower staple or a variety of brads. You can choose what type and length of clamps to use depending on your specific project requirements. The gun is fed by an eight-foot cord. While this can limit mobility if you don't use a wire extension, it does supply a steady stream of power, so you won't run out of water while working. The gun also uses dual power adjustment levers so you can switch between top and bottom for use with either hard or soft materials. While most pneumatic nail guns will work with any air compressor, it can be easier on the wallet if everything comes together. Jazz band kits like Bostitch BTFP3KIT will give you everything you need to go with your latch project. You will get three guns along with air compressors and tanks. Guns use 18-cup common nails or 16 pints in lengths up to 2 inches. A gun can also use a large crown stapler for things like covering furniture. The air supply starts with a 150-gallon maximum PSI tank. Air compressor pump fixed at 90 psi. Together, you should have enough power to drive nails and staples to most hard surfaces. Dial the air pressure on the pump for less force when working with softer materials. High gap, professional nail gun levels will offer you more options and flexibility while standing up to the typical abuse of larger projects. Bostitch F21PL makes changing settings and accessories on the gun fast and simple. For large projects such as home construction, it has two quick change nose pieces to connect wood or metal. Pressing the Depth Guide button also makes adjusting the desired depth fast as you move around. Attached to the air compressor of your choice, the gun has a working range of 80-120 PSI. More than enough for hard surfaces such as regular metals. At most, the gun can deliver up to 1,050 inches of force using a 60-nail magazine. There's no say that you have to stick with just a nail gun to finish the job sometimes, it's best to have different options on your side than you can do your best in the project. Instead of buying two or three separate nail guns, the Freeman P4FRFNBC gives you four different guns all designed with the same build quality and functionality. Each gun is designed with a different purpose in mind: full head frame for home construction, checking angles for tight corner construction, crown staples for delicate projects, and general nail guns for a variety of other projects. The range of choices means you will have anything you need inside a canvas bag. The overall purpose and angled guns are useful for cabinets, crown molds, and base boards. Crown Staples is a common tool for decorative projects such as image frames, trim, fabrics and other arts and crafts projects. Its final verdict is hard and durable, lightweight, and pounds in nails after nails without breaking sweats- or making you sweat while tackling most DIY projects around the house or yard. That's why the DeWalt DWFP12231 nail gun (available on Amazon) is our top choice. But if you need the kind of power, ease of use, and useful features only a professional tool can offer, turn instead to the Bostitch F21PL Nail Gun (available on Amazon). That extra space can come in handy, especially if you're driving a smaller vehicle and don't have a truck or your SUV. There are strange shaped items that can fit hard into your vehicle, such as bicycles or sking. The roof shelf can also accommodate the ladder. Roof racks can provide space to easily transport these large, unwieldy items. Picking roof racks on is simple as getting the first product that doesn't fit your vehicle, however. There are a range of potential models available, and each one has different features for different applications. To help you find the right one, we put together this guide the best roof shelf on the market. Our best roof shelf kick off this list with this collection of CargoLoc which looks, at least on the surface, into a very simple design. What we have is a rack designed to be used on the type of high ceiling rails often found on SUVs and station wagons. It is simply a clip designed on the rail with the help of a very good locking system. You simply place the bars where you want and then raise the tension with a simple small tool until you have the safe bar locked in place. They'll stay there, too, thanks to a built-in lock that secures the bar with a key and holds every robbery, look a little closer and you can see that. Comes with some features that you might not expect due to its lower mid-price point range. The best thing is all aluminum construction, which is equivalent to this power rod (the load capacity is 150 pounds, not bad at all) and save weight - the 46-inch versions weigh slightly below nine pounds, which is far less than equivalent steel versions. They also have round edges and low-profile design. Another set of aluminum bars designed for raised side rails, the stand-up design feature is that these side rails fit up to 50 inches apart, so there is only one size option with this product. Installation is very simple. It takes 10 to 15 minutes from the United Nations going to the full installation. At all, it's a very basic design, however they're largely very cheap. Don't expect any bells and whistles, but at the same time you can avoid racking up your bank account too much. If a criticism can be leveled at these bars it is one size fits all the design. They are made for use on side rails that are up to 50 inches apart. That's good if you have side competitors from that distance (or close), but if your rails are narrower, there will be a bit of bulge. As they are good and wide they are also going to be heavier than bars made for narrower rails, weighing almost 12 pounds total. However, it's rough to be too critical with that low price point. This roof shelf of Yakima certainly has the hallmarks of a premium product. High quality aluminum is used to build a bar with excellent overall weight capacity. Depending on size, the product has a total weight of between 10 and 13 pounds - not the lightest on the list but definitely not the heaviest either. It also has a lovely expense. That helps by stuck out items, but it also increases the aerodynamic profile of the bar. The weight bearing mass is spread over a shallow bar, flattery, and this is going to cut wind resistance and avoid impact on vehicle performance. The installation is very up to the right. This rack is designed to be used on the hidden rails you see on modern and smaller cars. It can also be installed on a vehicle without a railway, although you may have to buy additional installation kits for that option. Or the design of the robbers is protected by screwing or being installed inside the door frame, so there's no need to lock the model to protect it from burglars. At all, it's a well-designed roof shelf made of premium material, but depending on the size you need for your vehicle, it's ready to pay a premium price. In some ways it's a very basic model, which is actually somewhat of a standout feature. The main thing to note with this model is that it is designed to be used on a vehicle with bare roofs. In other words, one that does not have rails or attachment points of the drilled roof rack. That alone is a very useful feature because many modern car designs, especially smaller cars, do not come with anything on the roof equipped to help with Attachments. Yes, it gives modern car models a good look, simple, but we're supposed to attach kayak where? This rack simply slits into the door arch, and it even has a rubber-coated mounting plate that protects the color of the car. It's somewhat old fashioned but very common two-inch-diameter bars, so you'll have no problem finding accessories that fit the bar. They are steel construction and good and solid but slightly heavier than equivalent-sized aluminum rods. Altogether, they may be a little heavier, they may have been a bit old-fashioned, but going anywhere themselves, doing anything design is definitely very attractive overall. Despite its relatively low price, it's a very well-designed and built-in set of roof rack bars. First things first, these bars are designed to be used on a vehicle with side rails - whether traditionally raised design or modern solid rail design - these shelves are everywhere. Installation is nice and easy: put them into place and tighten the side clamps until they are in safe place. That's it, you installed your roof shelf when in position, they're locked in place with a key to secure them against any opportunistic roof shelf robbers. They are made of aluminum so have an overall low weight despite their impressive length (54 inches) and good overall maximum weight capacity of 150 pounds. They also have a lovely low-profile design that is highly aerodynamic to reduce any negative effects to vehicle performance. It suits your world that it's a really impressive feature, however. They are designed to span a rail gap between 34.5 and 49.5 inches. That means they are suitable for a wide range of car models. Just measure the rail gap before ordering. These bars from Kova Gera are also universal and designed to be mounted on side rails. They also have budget rails on our list, rolling up with a price tag that is quite affordable. So, expect the bells and whistles that you might find on a more premium model. That would be said, these rails are useful enough with some good design points. First of all the installation is right. Put them in position, tighten the two connections to the place, and go round you. Aluminum is used as the main material of construction in general low weight. They also boast key locks that helps keep them on their roofs and not on trunks stealing roof racks. They don't quite have a low profile of more premium plans, so they may end up having a bit of a negative hit on car performance. That to be said, they are very cheap but very effective. Know what the budget model is buying. Expect some aspects to have slightly lower quality of more expensive products and just enjoy them for what they are - very simple but straightforward and effective roof shelf bars. This is our list of the best roof racks out there on the market right now. As you have seen there can be a significant difference in design, materials, and - most importantly - prices across the entire range. What's more, you need to ensure that you're choosing a roof shelf that would be perfect for fittings on your vehicle - whether it's raised as side rods, solid side bars, raised points or nothing at all. Once it is installed, you need to be careful to load it safely to protect both other road users as well as your stuff. After all, once you load up the roof shelf, you want to know the items you put up there are going to stay there. To this end then we're going to look through some features, give you some advice on how to fit and then load your roof shelf, before answering some often asked questions about this type of product. We're not great, are we? Features looking at the roof rack Aerodynamic/low profile design - well, it's very obvious that kayak straps and a couple of mountain bikes to car roofs are going to negatively affect performance and fuel economy. But you should also consider the long-term effect that your bars can take. As the article put it, the roof rack can turn your car into a real guzzler gas! Now, the effect is probably not quite going to extreme it, however choosing a low profile rod or rack that is designed with aerodynamic performance in mind can really help offset any negative issues. Connections - You need connections that work with your vehicle design. See the section below where we discuss the different ways you might connect the roof shelf to the vehicle. Construction Materials - Options you are here are going to be steel and aluminum. Steel is generally cheaper, but slightly heavier. Aluminum is usually found on more premium models, but quite a little lighter. Key Lock - Roof racks that are attached with clamps should be secured with key locks to prevent thieves from stealing them. Roof racks that are secured through repair points or inside the door jamb do not have to be locked. Weight Capacity - How much weight do you plan on carrying? Most of the shelves on this list will take 150 to 160 pounds, which should be enough for most car trips. Safety tips when using roof racks using roof racks are generally a very safe and direct effort. Think about it, if people normally ended their journeys just to get out of the car and find out that all their belongings disappeared during the journey, they wouldn't use things anymore, would they? In fact, a pointing place look as you drive down almost every highway will show that hundreds and hundreds of people place their trust on their roof shelves to deliver your load safely from point A to point B. These people are almost certainly looking for a good set of safety tips, and if you want to like them (in other words smart) then you should take a look at these useful safety tips too: the correct fit - nothing roof rack is less safe, and more likely to load it, then if it doesn't have the correct fit. Think about it, all this stuff. Outside in the wind, zipping along at 70 mph, is often loaded with odd loads shaped by more than 100 pounds. That can put a lot of pressure on the rack that it can easily deal with, but only if it is suitable for your vehicle. So make sure you are buying the right size rack for your vehicle with the correct installation points. Proper installation - When you have the right roof rack for your vehicle, the next step is to ensure that it is properly installed. Most shelves are relatively easy to install, and many are available that can be put in safe place with minimal tools, sometimes even with none. Try to choose a style from the roof shelf you are sure you can install. Height limit - Keep in mind that your car's roof rack is taller, as well as whatever you load on it will also increase that total height. If you already have a tall vehicle, such as an SUV, then you should be aware of low altitude alerts, especially if you are loading tall or bulky objects like kayaks or straight mountain bikes. Center of Gravity - Heavy load can compensate the center of the vehicle's gravity if it is not loaded properly. Fortunately, this is very easy to avoid, just aim to load heavier items towards the center of the roof and not turn off to one side or all in front or rear of the available space. Work from the middle out, and put light items around the edges and sides of the space. Total weight - finally, always keep in mind the safe total weight that the roof rack can handle. Also consider how that weight is shipped. So a rack that can be 150 pounds can be loaded with that amount if the load is safely and evenly distributed. If however the weight is concentrated in a smaller area, such as one or two dense and heavy objects then extra care. It's really simple, right? Just keep these points in mind as well as always remember the capacity of your roof shelf and you should have no problems. How to tie things to your cars roof racks if you want to make items safe to the ceiling, then one of the most important lessons you need to learn is how to safely load safely. One of the keys, especially when it comes to securing larger loads, is to use a suitable node to secure the ropes. Don't worry, it's not a boy scout thing, you don't have to learn a hundred of them and get a stupid badge. In fact, there's only one you need to know, and it's called a trucker knot, because what else is it called? Click that link to see a great guide to this very useful node. As for loading out your roof shelf, please click on this link to see a great (and wisely short) lesson in loading the right roof rack, delivered by an Australian monotone man with a cracking moustache. Best FAQ Roof Shelf: Do you have any questions about the roof shelf? If so, we try to answer them here. If your question is how do I strap a dead body into a roof shelf? Please be aware that we have transferred your IP address to the FBI. Q: Is it Roof Shelf My car? A: No it won't, which is why we made a point of highlighting in each product review what kind of vehicle each roof shelf was appropriate. There are basically 4 ways that roof racks can be secured to the roof of your vehicle, and they depend on the car equipment you are currently equipped with. High ceiling rails - most likely seen in SUV and station light car wagons. These, as the name implies, are the rails that come up, possibly about 2 inches, on the roof of the car. Solid roof rails - much like the top, except they have no gaps between the railroad and he doesn't have a car roof. This makes them look all cool and simple, so you'll likely find them on cars and SUVs with a more modern design style. Both types of railways, despite looking different, act exactly the same way. Fixed points - Some vehicles on the other hand come with pre-installed fixed points. They basically dug holes in the roof of the car and filled with some kind of plastic bong or helmet. If you have one of these, then you need to find it, remove the cover and then attach your roof shelf by screwing it through the hole. Repair points will be on either side of the car, often covered by a strip of plastic or plastic casing, helping them to blend into the car's design. Nothing - and some cars are nothing! This is especially common in smaller sizes, and modern cars. But don't be afraid - not everyone is missing! What you need to do in this case is pick up a roof rack that is safe to jamb the vehicle through the door - this is the cutter that sits the car door. It can be just as safe - and just as strong - as any shelf that is attached to rails or fixed points. Q: How do I know what kind of roof shelf I need? A: The first thing you need to do is read the section above to see how secure your rack will be. Once you know that, the next thing you need to know is what distance the rod should stretch across. Depending on the type of roof shelf, you may have to look up your car model on the production website to see which model is made for your particular vehicle. If you pick up a global shelf however, all you have to do is check that it will cover your distance between measuring rods - nice and simple! Q: Can roof shelves be removed? B: They don't work or glue in their place, so yes they can. However, you may want to keep removing them all the time, especially if you have chosen a model that is connected through a repair spot, which can be fiddling to get on and off. Widely spoken, the tape that clamps on a rail will be repeatedly the easiest solution to get on and off. You may also like: The best gift for our top choice car lovers is the top choice for these types of products as it is to look with some of the others that we have here in the Car Bible. That's because we can happily recommend what we consider the best product - but if it actually suits your particular car that recommendation is worthless. So we want to make the top two choices. Cna Do that? Well, who's gonna stop us, huh? Exactly. First of all, we are going to recommend a model for vehicles that have roof rails installed - whether old-style raised rail or modern solid rail. If you have one of these, we offer cargo manager Vault a 54-inch Global Lock Ceiling Shelf (product number 5 on the list above). It's just a very well designed roof shelf. Easy to install, no size options to Wade through, good maximum weight capacity, lightweight but solid aluminum construction and decent aerodynamic design to minimize drag. Our other top choice is, in many ways, the polar opposite of our other choice. We are talking SportRack Full Ceiling Rack System (item number 4 on the list). Now yes, as we noted in the design this design is very basic and somewhat outdated. This stand out feature however is that it is designed to be installed on vehicles without side rails at all. That makes it very useful on the market today when smaller cars without any side rails or roof rack mounting points are becoming more and more common. Sources: Add your points
